NLR is researching advanced electrochemical energy storage systems, including redox flow batteries and solid-state batteries. Electrochemical energy storage systems face evolving requirements. Electric vehicle applications require batteries with high energy density and fast-charging capabilities.

Electrochemical energy storage systems have the potential to make a major contribution to the implementation of sustainable energy. This chapter describes the basic principles of electrochemical energy storage and discusses three important types of system: rechargeable batteries, fuel cells and.

electrochemical energy storage system is shown in Figure1. charge  $Q$  is stored. So the system converts the electric energy into the stored chemical energy in charging process. through the external circuit. The system converts the stored chemical energy into electric energy in discharging process.
