

# Energy storage batteries are integrated into the grid

## Overview

---

Battery energy storage systems provide electricity to the power grid and offer a range of services to support electric power grids.

Battery energy storage systems provide electricity to the power grid and offer a range of services to support electric power grids.

Utility companies across the world have begun replacing coal- and gas-fueled power plants with large batteries that store solar and wind energy. In the United States, California and Texas are leaders in deploying this technology, with states including New York developing a nascent capacity for.

The worldwide ESS market is predicted to need 585 GW of installed energy storage by 2030. Massive opportunity across every level of the market, from residential to utility, especially for long duration. No current technology fits the need for long duration, and currently lithium is the only major.

Utility-scale battery energy storage systems have been growing quickly as a source of electric power capacity in the United States in recent years. In the first seven months of 2024, operators added 5 gigawatts (GW) of capacity to the U.S. electric power grid, according to data in our July 2024.

The grid is a real-time network where electricity generation must constantly match consumption. This system has served us for a century, but its lack of storage capacity is a critical vulnerability, especially as we transition to intermittent renewable energy sources. This is where a new generation.
