

How to deal with power outages at 5g base stations

Overview

How will 5G be used in the future?

Reprinted, with permission, from ref. In the foreseeable future, 5G networks will be deployed rapidly around the world, in cope with the ever-increasing bandwidth demand in mobile network, emerging low-latency mobile services and potential billions of connections to IoT devices at the network edge .

Does BS load rate affect the power consumption of 5G networks?

the power consumption of AAU nearly linearly increases with the growth of BS load rate, while that of the BBU is quite stable at varying load rates. As the power consumption of 5G BSs is significantly higher than that of 4G BSs, we focus on the backup power allocation of 5G networks in this work.

How do you localize a network outage?

Once an outage is detected, (1c) localizes the outage by identifying the affected users (oUEs), served users (sUEs), and compensating base stations (cBS). Module 2 starts with (2a), determining whether the outage involves a single or multiple base stations. Based on the outage level, the appropriate compensation strategy is selected in (2b).

What is a power outage?

An outage is specifically identified for practical implementation when the reference signal received power falls below a threshold, typically ranging from -120 to -140 dBm, within the coverage area of base stations.
