

# Internal rate of return for energy storage projects

## Overview

---

IRR measures the return on investment for energy storage projects and represents the average annual rate of return, resulting in a net present value of zero. It helps assess the profitability and payback period of a project to determine its economic feasibility.

Based on the internal rate of return of investment, considering the various financial details such as annual income, backup electricity income, loan cost, income tax, etc., this paper establishes a net cash flow model for energy storage system investment, and uses particle swarm optimization.

This paper assesses the profitability of battery storage systems (BSS) by focusing on the internal rate of return (IRR) as a profitability measure which offers advantages over other frequently used measures, most notably the net present value (NPV). Furthermore, this study proposes a.

This is the text version for a video—Levelized Cost of Electricity (LCOE) and Internal Rate of Return for Photovoltaic (PV) Projects—about how NREL conducts such pro forma analysis. It's Part 4 of NREL's Solar Techno-Economic Analysis (TEA) Tutorials video series. [Audio begins] Hello. Thank you.

To assess the feasibility, profitability, and payback period of such projects, three key indicators are commonly used: Levelized Cost of Storage (#LCOS), Internal Rate of Return (#IRR), and Net Present Value (#NPV). #LCOS Cost of Electricity: LCOS represents the full life cycle cost of energy.

You know, over 40% of solar+storage projects completed in 2023 missed their projected internal rate of return (IRR) by 3+ percentage points. The culprit?

Most developers are still using outdated IRR calculation models that ignore three critical factors: Wait, no—it's not just about the upfront.

What is internal rate of return (IRR) and how does it affect design and investment decisions for solar projects?
