Electrochemical energy storage and conversion constitute a critical area of research as the global energy landscape shifts towards renewable sources. This interdisciplinary field encompasses devices such as batteries, fuel cells and supercapacitors that transform and store energy through redox.

Electrochemical energy conversion and storage (EECS) technologies have aroused worldwide interest as a consequence of the rising demands for renewable and clean energy. As a sustainable and clean technology, EECS has been among the most valuable options for meeting increasing energy requirements.

Energy storage is the capture of energy produced at one time for use at a later time [1] to reduce imbalances between energy demand and energy production. A device that stores energy is generally called an accumulator or battery. Energy comes in multiple forms including radiation, chemical.
