

Zinc-bromine flow battery enterprise

Overview

Scientists developed a way to chemically capture corrosive bromine during battery operation, keeping its concentration extremely low while boosting energy density through a two-electron reaction. This approach sharply reduces damage to battery components and allows the use of.

A zinc-bromine battery is a rechargeable battery system that uses the reaction between zinc metal and bromine to produce electric current, with an electrolyte composed of an aqueous solution of zinc bromide. Zinc has long been used as the negative electrode of primary cells. It is a widely.

A new advance in bromine-based flow batteries could remove one of the biggest obstacles to long-lasting, affordable energy storage. Scientists developed a way to chemically capture corrosive bromine during battery operation, keeping its concentration extremely low while boosting energy density.

A zinc-based, rechargeable flow battery is now at production level after Office of Electricity funding. Office of Electricity provided Primus Power support to deploy a 25 MW/75 MWh zinc-based flow battery through \$14 million in ARRA funding. This project changed over time and contributed to Primus.

Zinc-Bromine Flow Batteries (ZBFB) are a type of rechargeable flow battery that provides an efficient and sustainable energy storage solution. Known for their high energy density and scalability, these batteries are ideal for large-scale energy storage applications, such as stabilizing power grids.

Aqueous zinc flow batteries are gaining momentum as a safe, cost-effective, and scalable solution for large-scale energy storage, particularly as the global energy sector pivots toward renewables. Innovations in this technology have significantly improved energy density, lifespan, and efficiency.
